DETAILED ACTION

Claims 1-12 are presented for examination.

Information Disclosure Statement

The information disclosure statement filed 10/14/2008 fails to comply with 37 CFR 1.98(a)(3) because it does not include a concise explanation of the relevance, as it is presently understood by the individual designated in 37 CFR 1.56(c) most knowledgeable about the content of the information, of each patent listed that is not in the English language (Foreign patent document: DE 32 41 821 A). It has been placed in the application file, but the information referred to therein has not been considered.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-12 are rejected under 35 U.S.C. 102(b) as being anticipated by Hong et al. (hereinafter 'Hong') US 6,646,894.

As to claim 1, Hong teaches a switching regulator [col. 1, lines 10-11] converting an input voltage into a predetermined constant voltage and outputting the constant voltage from an output terminal [col. 3, lines 27-31], the switching regulator comprising:

Art Unit: 2115

a switching transistor controlling output of the input voltage by switching in accordance with a control signal input to a control electrode [col. 3, lines 57-64];

a smoothing circuit part configured to smooth an output voltage of the switching transistor and output the smoothed output voltage to the output terminal [col. 3, lines 17-18];

a control circuit part configured to control the switching of the switching transistor [col. 3, lines 62-64] in synchronization with an externally input clock signal so that a voltage at the output terminal is the predetermined constant voltage [col. 5, lines 3-8]; and

a clock signal detector circuit part configured to detect presence or absence of inputting of the clock signal [col. 3, lines 39-43],

wherein upon detecting stoppage of the inputting of the clock signal, the clock signal detector circuit part causes the control circuit part to stop operating and perform a standby operation for reducing power consumption and thereby to turn off the switching transistor [col. 5, lines 1-8 and col. 6, lines 21-23, lines 39-40].

As to claims 2-12, Hong clearly teaches the limitations to these claims.

Response to Arguments

Applicant's arguments with respect to claims 1-12 have been considered but are moot in view of the new ground(s) of rejection.
